

Before you print

Check the actual exported code and a finished proof—not just the generator preview. Use this sheet before ordering a batch.

Check the destination

- ☐ Scan the exported image. Confirm the exact link or action is the one you intended.
- ☐ Open links as a guest, without your signed-in account. For Wi-Fi, test joining on a phone that is not already connected.

Check the size and image

- ☐ Choose a starting size for the real scan distance. A sizing rule or calculator is not a guarantee.
- ☐ Use a dark pattern on a light background. Send an SVG if your printer accepts it, or a PNG with enough pixels for the final size.

Keep the margin

- ☐ Keep at least four modules of clear space on every side. One module is one small square in the pattern.
- ☐ Keep text, trim, folds, and artwork outside that space. Do not stretch the code or assume a logo is safe because it is centered.

Test the finished piece

- ☐ Print one proof at actual size. Test on more than one phone, at the normal distance and in the expected lighting.
- ☐ Test through the real frame, stand, glass, or finish. Check that the destination works, not just that the phone recognizes the image.

Record the result

Piece / placement _____

Test date / phones _____

Size / distance _____

Fix before ordering _____

If anything fails, fix it and test again before ordering. Keep a readable fallback link or connection instructions nearby. Recheck signs when destinations or network details change.
